Preface to the Third Edition

New technologies at the time the first edition of Color Atlas and Text of Pulmonary Pathology was published allowed us to create a unique textbook of digital age conciseness with all figures printed in color. Subsequently, those technologies have become widespread, but the distinctive virtues of the original work have not been duplicated. In the decade since the publication of the second edition of this book, diagnosis in pulmonary pathology has undergone a number of modifications. New entities have been described, older entities redefined, and several major classifications revised: An update of the 2002 American Thoracic Society/European Respiratory Society (ATS/ERS) classification of idiopathic interstitial pneumonias was published in 2013; the Fifth World Symposium on Pulmonary Hypertension was held in Nice, France, in 2013; the fourth edition of the World Health Organization Classification of Tumours of the Lung, Pleura, Thymus and Heart was published in 2015. Since the second edition, the introduction of testing for molecular targeted therapies and other advances has forever altered the role of the pathologist in the diagnosis and treatment of pulmonary diseases.

We elected to produce a third edition that is not merely an adjustment of the previous text based on new developments in pulmonary pathology, but one predominantly constructed by new editors and largely written by new contributors. Even the title of the book is modified to reflect this progress: Pulmonary Pathology: An Atlas and Text, third edition. While it is a newly composed book, the general format of a user-friendly atlas that is highly illustrated, divided into readily accessible individual entities, and offering brief
